

The Name of your application: Forever Paws

- GitHub repository link: [https://github.com/JonathanDarg/CS456\\_Web\\_Project](https://github.com/JonathanDarg/CS456_Web_Project)
- Members of your team: Meghan Burton, Jonathan Dargakis

- General Description of the application you plan to develop.

We plan to develop a dog adoption website where people can visit and learn about dogs and the importance of adopting. And allowing individuals to select and find their perfect dog to adopt through our selection. And even allow access for our members to sign up to become a volunteer and get involved in the organization by spreading awareness, supporting our cause, and helping out our facilities and community.

We will accomplish this by developing a static html webpage that will include a navbar, hero section, footer, info about our mission, and cards of our available dogs, and general content like why they should adopt and how they can get involved in our community. Incorporating buttons and links to view our available dogs and contact us to get involved which currently will display javascript window alerts about our dogs and contact info so our clients can be informed. And links to our many useful pages that include our dogs, care tips, events, volunteer, and donations. And will utilize Bootstrap to create a responsive design that will adapt and change for extra small devices, and medium devices. And incorporate a Css file to include custom designs in our navbar, footer, and various components to incorporate our custom design. And use Adobe monochromatic colorwheel for #665C50 to create our website colors. And footer section where after viewing our website can contact us and visit our social media sides by clicking on the icons and visit important pages through the links to the pages.

- Target audience

Families looking to learn about taking care of dogs, adopting, or volunteering at an adoption center.
